

Use Recommendations

- Add Cadet to your normal tank mix program of glyphosate.
 - Use 0.5 oz - 0.9 oz/ acre
- DO NOT spray when raining or misting. Avoid applications when heavy dew exists, generally early in the morning or late at night.
- Can add AMS if recommended by tank mix partner.
- In general, if using Cadet with a surfactant loaded glyphosate, no additional adjuvants are required.
- Cadet is a contact herbicide. Thorough coverage is required for satisfactory control. Be sure sprayer is properly calibrated to deliver Cadet and it's tank mix partner to provide thorough coverage. Use 15 gpa minimum for best control. Use appropriate nozzles, pressure and nozzle placement to avoid placing the product in the corn whorl.
- If the tank mix partner requires additional adjuvants, any NIS above 0.25% v/v or the addition of COC may increase leaf speckling or bronzing.
- For optimum weed control apply the Cadet + glyphosate tank mixture to weeds less than 4" tall.
- For Cadet + Ignite[®] no additional NIS or COC is recommended.
- Tank mixes with Lorsban[®] or other organophosphate insecticides are not recommended.

Always read and follow label directions.
